Anhydrous Ammonia Explosion in West, Texas

Daily Situation Report (SITREP) #3

Reporting Period: Wednesday, April 17 - Sunday, April 21, 2013

Current Situation:

- West Fertilizer Chemical plant caught fire the evening of April 17, 2013. While firefighters were responding, a large explosion took place around 2000 sending a large plume of smoke into the air. The explosion leveled multiple blocks of the town. It was determined that the plant held anhydrous ammonia.
- TCEQ reported to DSHS that they were detecting 60-100ppm of ammonia at points fairly close.
- Poison Centers collected data from calls in which information regarding the chemicals involved were requested or where a person reported being exposed to toxic fumes.
- The TPCN received a total of 21 calls from the evening of 4/17 through 4/21. Of these calls, 9 calls were possible exposures and 12 were requests for information calls.
- The TPCN is providing Anhydrous Ammonia Explosion related case data to the Texas Department of Health and Human Services for statistical purposes.
